

RM398 Bridge End Hazard Markers

RM398 will be installing bracket holders for the Bridge End Hazard Markers located on both sides of each end of the bridges in RM398.

The markers will allow for the sign to be temporarily removed when over-width vehicles travel on bridges. The operator will be required to exit their equipment, remove the marker and then replace the marker after passing through. The markers will be connected to the bracket with a chain.

We ask transporters of this system to use care and attention on the removal and replacement of the signage and to notify the RM office if the system or bridge requires attention.
